The challenge

Why traditional SOP management fails enterprise insurers

THE CURRENT STATE

- **Weeks to map one SOP**
Manual decomposition of a single end-to-end process by analysts.
- **No benchmark**
SOPs reviewed with nothing concrete to compare against.
- **Blind to platform fit**
Is the process aligned to the core insurance system's best practice?
- **Gaps surface late**
Found at audit, system migration, or compliance review — not before.
- **Optimisation is reactive**
Driven by incidents rather than evidence and analysis.

THE BUSINESS IMPACT

67%

of core-system / ERP implementations exceed budget due to process misalignment

4–12 wks

typical time to manually map and document one end-to-end process

3.5×

more likely to meet project goals with well-documented, validated SOPs

The Flow Agent app

Two modes, one workflow — live now in the browser

- **Two ways in**
Demo: 13 pre-analysed insurance SOPs, instant and free. Live: upload your own SOP (PDF / text).
- **One click**
Pick or upload a SOP and generate all six deliverables in minutes.
- **Browser-based**
Nothing to install — it runs as a secure web app.
- **Preview & download**
View every output in-page; download individually or as a zip.

Demo — frozen, authored SOPs

Renders the six deliverables from the committed analysis in `sop_data/`. Deterministic, no API call, no cost.

Choose a SOP

SOP-INS-001 · Online Insurance Sales

Generate 6 deliverables

How it works

From SOP to blueprint in three moves

1 · SOP in

Upload your SOP or pick one from the demo library.

2 · AI analysis

Decompose into phases, roles & swimlanes; score fit-gap against the matching insurance platform catalog; author the optimisation.

3 · Six deliverables

Styled, ready-to-use PDFs — flows, fit-gap, and an optimised SOP.

Benchmarked against the platform that fits each domain: Guidewire PolicyCenter · BillingCenter · ClaimCenter · Majesco · Sircon (Vertafore) · Salesforce Service Cloud.

The analysis is authored once and frozen as canonical JSON, so every render is reproducible — the same SOP always yields the same blueprint.

Example: generated swimlane (excerpt)

The six deliverables

Every output downloadable and ready to use

Process swimlane

BPMN-style lanes by department with decision gateways.

Hierarchy view

Phase-by-phase breakdown with owners and timings.

Fit-gap executive

Alignment vs the insurance platform catalog.

Optimised swimlane

Same flow with NEW / ENHANCED steps highlighted.

Optimised hierarchy

Revised phases after the fit-gap remediation.

Optimised SOP doc

Full document with colour-coded change banners.

Outputs screen — preview & download

Fit-gap analysis

How aligned is the process to the system that runs it?

Optimised SOP & process flow

Fit-gap findings become a revised, ready-to-adopt SOP

NEW

a step the catalog requires but the SOP lacked

ENHANCED

an existing step strengthened to best practice

The fit-gap findings drive an automatic SOP revision. Added and strengthened steps are folded back into the swimlane, hierarchy, and the SOP document — colour-coded so reviewers see exactly what changed and why, with a version-control trail.

STANDARD OPERATING PROCEDURE — OPTIMISED

Medical Claims Processing

Optimised per Fit-Gap Analysis against the Guidewire ClaimCenter Health Claims Catalog

Document Reference	SOP-INS-011
Version	3.0 (Optimised)
Effective Date	01 September 2026
Supersedes	v2.3 dated 01 March 2025
Owner	Medical Claims — Claims Operations
Approved By	Chief Claims Officer
Optimisation Reference	Fit-Gap Report FG-INS-011 dated 18 June 2026
Catalog Alignment Score	92% (up from 71% in v2.3)
Classification	Internal Use Only — Claims Restricted

OPTIMISATION SUMMARY — What changed in v3.0

This version incorporates 5 remediation actions from Fit-Gap Report FG-INS-011. Alignment to the Guidewire ClaimCenter health-claims catalog increased from 71% to 92%. Critical additions: duplicate & coordination-of-benefits (COB) checking, case reserving at registration, provider tariffnetwork validation, concurrent utilisation review, and a post-settlement recovery process. Routine claims now auto-adjudicate.

- NEW STEP (green) — step added to close a gap vs the ClaimCenter catalog
- ENHANCED (amber) — existing step updated with additional controls or automation

1. Purpose

This Standard Operating Procedure defines the end-to-end process for receiving, validating, assessing, and settling medical insurance claims submitted by Meridian policyholders. Version 3.0 incorporates optimisations identified through fit-gap analysis against the Guidewire ClaimCenter Health Claims Best-Practice Catalog, achieving 92% alignment (up from 71% in v2.3).

Key additions in v3.0: duplicate and coordination-of-benefits checking at first notification, case reserving at registration, provider tariff validation, concurrent utilisation review for inpatient stays, straight-through auto-adjudication of routine claims, and a post-settlement recovery process for overpayments, COB and subrogation.

Optimised SOP document

Upload your own SOP

Live mode — turn any SOP into a full blueprint

- **Upload your SOP**
Any PDF or text document — your own process, not a demo.
- **Automatic analysis**
The engine authors the canonical analysis from your SOP.
- **Validated, then rendered**
Checked against the contract before the six deliverables are produced.
- **Review & download**
Inspect the structured output, then download everything.

Analyze & generate

What makes Flow Agent different

Four reasons it stands apart

Minutes, not weeks

A complete blueprint from one SOP, not an analyst's multi-week effort.

Grounded in catalogs

Every diagram compared against an insurance platform's best practice — not guesswork.

Two modes

Instant demo library plus live upload of your own SOPs.

Six ready outputs

Swimlane, hierarchy, fit-gap, and the optimised flows + SOP.

From a raw SOP to an insurance-grade, platform-aligned blueprint — in minutes, not weeks.

Frequently asked questions

How Flow Agent benchmarks each SOP — the fit-gap method

What does Flow Agent compare each SOP against?

Not a generic workflow library. Generic processes (the HR and Finance examples) are compared to a general best-practice workflow reference; domain-specific **insurance** SOPs are graded against the industry-standard **software platform** an insurer would actually run that process on — Guidewire PolicyCenter / BillingCenter / ClaimCenter, Majesco, Sircon (Vertafore), or Salesforce Service Cloud.

How is each step graded?

Every step is mapped to a specific platform control and tagged   . The counts roll up into an **overall fit %**, per-phase fit bars and a controls-coverage radar; the gaps then drive a ranked remediation roadmap and a projected post-remediation fit score.

How are the catalog reference codes chosen?

Each SOP is matched to the platform best fitting its domain; within that platform each step is matched to the named process control (FNOL, coverage evaluation, reserving, recovery...) and tagged with that control's code, e.g. **GW-CC-FNOL-01**. The code anchors every judgment to a named standard so the analysis is auditable rather than subjective.

Worked example — SOP-INS-011 Medical Claims

Graded against the Guidewire ClaimCenter health-claims best-practice catalog

HOW THE SCORE IS BUILT

The SOP is decomposed into **3 phases / 16 steps** (Receipt → Assessment → Settlement). Each step is matched to a ClaimCenter control and scored, giving an **overall fit of 71%** and the critical missing controls below.

FIT

Multi-channel claim intake

GW-CC-FNOL-01

Portal / app / hotline / post intake aligns with ClaimCenter FNOL multi-channel capture.

GAP

Coordination-of-benefits check

GW-CC-FNOL-05

ClaimCenter requires a duplicate & other-insurer (COB) check at FNOL. SOP does neither — double-payment risk.

PARTIAL

Document completeness

GW-CC-FNOL-04

Completeness check & 7-day request exist, but no automated diary / escalation when documents arrive late.

Critical gaps → COB, FNOL case reserving, provider-tariff pricing, subrogation/recovery. Each becomes a ranked remediation action with an effort estimate and a **projected post-remediation fit**.

REFERENCE CATALOG BY DOMAIN

SOP	DOMAIN	REFERENCE CATALOG (BENCHMARK)
INS-001 / 004 / 008 / 010	Sales / new business / underwriting	Guidewire PolicyCenter
INS-002	Premium billing	Guidewire BillingCenter
INS-003	Collections	Guidewire BillingCenter (Collections)
INS-005	Producer licensing	Sircon (Vertafore) PLM
INS-006 / 007	Group benefits / quoting	Majesco Group Benefits / Distribution
INS-009	Customer servicing	Salesforce Service Cloud
INS-011	Medical claims	Guidewire ClaimCenter (Health)
INS-012	P&C claims	Guidewire ClaimCenter (P&C)
INS-013	Policy lifecycle	Guidewire PolicyCenter (system of record)

Frequently asked questions

Determinism & accuracy of the analysis

Does Flow Agent call an LLM every time it builds the deliverables?

No. The analysis for each SOP was **authored once** and frozen as canonical JSON with a SHA-256 manifest. The build is a pure renderer over that JSON — no network call, no randomness — so re-running it reproduces every PDF exactly. Any LLM use (authoring or a future semantic judge) is a deliberate, opt-in, **cached** step behind the JSON boundary, reviewed and committed — never a build dependency.

How do you know the generated flow is faithful to the source SOP?

An advisory accuracy check grounds every role, named system, and numeric threshold in the flow against the source SOP text using deterministic lexical matching, and reports anything ungrounded. Intentional optimisation additions (the NEW / ENHANCED steps) are listed separately as expected, not flagged. True semantic equivalence would be a separate, opt-in LLM-judge step.

Why benchmark against a software platform rather than a written standard?

Because the platform's best-practice process model is the most concrete, testable definition of “good” for that domain: it specifies the controls, sequence and data a mature insurer's process should contain, which is exactly what a fit-gap needs to measure against.
